The Interactions of Hadrons

by H. PILKUHN, Department of Theoretical Physics, The University of Lund

1967. 390 pages. Hfl. 50.— (100s.)

This is a textbook on strong and weak interactions. It also includes electromagnetic interactions, with the exception of radiative corrections.

The conventional formalism of Lagrangian field theory is replaced by the S-matrix approach, which is more appropriate for the application to hadron interactions.

This makes it possible to dispense with the methods of local fields, second quantization and renormalization, which take a large portion of most textbooks, although their practical use is restricted to radiative corrections. Instead, unitarity, unstable particles and resonances are treated to the large extent required by the applications.

Many formal derivations have been simplified (see e.g. the helicity formalism). Important calculations are done very thoroughly.

An important portion of the book is dedicated to the phenomenological analysis. Models and theoretical speculations are presented with the caution which is necessary for a textbook. Many experimental results are included.

CONTENTS: Kinematics and phase space. Collisions and decays of spinless particles. Spin. Survey of baryons and mesons. Resonances and SU_3 symmetry. S-Matrix theory. Theory of low-energy πN scattering. $\bar{K}N$ interactions and multi-channel formalism. Helicity and polarization. Electromagnetic interactions of hadrons. High-energy interactions. Weak interactions between hadrons and leptons. Neutral kaons. Appendices.

High-Energy Physics and Nuclear Structure

edited by G. ALEXANDER, The Weizmann Institute of Science, Rehovoth

1967. 500 pages. Hfl. 75.— (150s.)

This book contains the Proceedings of the Second International Conference on High Energy Physics and Nuclear Structure held from February 27 to March 3 1967 at the Weizmann Institute of Science, Rehovoth, Israel, and organised jointly by CERN and the Weizmann Institute. The unique feature of this conference was to bring together physicists from the fields of both nuclear physics and elementary particle physics for the purpose of discussing subjects of mutual interest.

In particular the following subjects were covered:

1) Hyperon interactions and hypernuclei
2) Interactions of electrons, mesons and nucleons with nuclei including mesic atoms
3) Diffraction phenomena in nuclear and elementary particle interactions
4) Nuclear astrophysics

The book presents the invited papers and the ensuing discussions. In addition abstracts of the contributed papers submitted to the conference are given.
